

## Operator Safety Training and Re-Qualification Training and In-House Instructor Training in Vancouver

Utilized in just about all boat yards, industrial construction sites or warehouse operations, the lift truck is a very important part to help pick up and transfer cargo. The reach feature of a forklift could help improve the applications that the forklift could do like for example stacking pallets on an elevated shelving unit. A lift truck operator will utilize the machine's reach feature to grab pallets which could be placed on a top shelf and places more difficult to grasp.

It is essential for an driver to first test the machine and help familiarize the operations of a reach. Learn how the equipment moves, turns, check the speed that the forklift travels and how fast it could pick up and drop objects before you attempt to handle merchandise. Note whatever safety measures which may come into play. Pay attention to how the machine will slow down when the tines are up in the air.

Begin with raising lighter objects such as an empty pallet, to be able to become comfortable with the reach function of the forklift. Once the pallet is attached to the blades, tilt them back so the load can safely sit against the grate. This safety grate is situated at the rear of the the tines and keeps the load from sliding. Set pallets down where preferred by reversing the process. Tilt the blades down over the intended site and level them. The pallets should simply slide away from the safety grate. Set the pallets down.
